

Example 1 :

```
System.out.println("The BlueJ provides");  
System.out.println("An Easy Programming Environment");
```

Output :

The BlueJ provides
An Easy Programming Environment

Note that in example 1 the two print statements contains arguments/messages within the brackets. The output of these two lines will be printed on the different line because the `println()` automatically shifts to the new or next line after completing the task. So after printing **The BlueJ Provides** the control shifts to the new line due to 'ln' and **Integrated Development Environment** will be printed on the new line.

Example 2 :

```
System.out.println("The value of X = " + 13 );  
System.out.println("and the value of Y = "+24);
```

Output :

The value of X = 13
and the value of Y = 24

Note that in example 2 the two print statements contains arguments/messages within the brackets and as in the previous example both the messages are printing in different lines due to 'ln'.

EXERCISES

Q. 1. Fill in the blanks :

1. The expansion of IDE is Integrated Development Environment
2. The terms on state, off state and out of order state, are the features of an object.
3. A class contains data and methods.
4. The Java software starting window is known as project window.
5. The entity that combines data and its associated function as single unit is known as a class.

Q. 2. State True or False :

1. The Java is platform independent programming language. **T**
2. The compilation of program is the first task after writing it. **T**
3. The methods of a class can also be executed without an object. **F**
4. The Jar file contains many files of a project as a single file. **T**
5. It is not essential to have a Java program within the class. **F**

Q. 3. Define an object with a real life example.

Ans. -An object represents real world entities like Student, Ball, Box etc
-Objects have identity, state and behaviour

Q. 4. What do you mean by OOP? Name all its principles.

Ans. - OOP is a programming paradigm based on the concept of objects which contain data and code

- Principles are :- Abstraction, Encapsulation, Inheritance, Polymorphism

Q. 5. What do you mean by a class? How is an object related to a class?

Ans. - class is a blueprint for creating objects
- it represents a group of objects.

- object is an instance or tangible form of the class

Q. 6. A class is also known as object factory. Justify.

Ans. just like a factory produces many but similar items similarly many objects can be created from a class

Q. 7. What do you mean by comment statements? Explain the types of comments.

Ans. - comments are statements that are not executed or compiled
- it is used for explaining the code

- Types: Single line - represented by //
Multi line - represented by /* */

Q. 8. What do you mean compilation process?

Ans. - it is the process of converting high level code to Machine code

Q. 9. State the difference between print() and println() methods.

Ans. print() prints data in a line and leaves the cursor in the same line

println() prints data in a line and takes the cursor to new line

Q. 10. What is the use of keyword class?

Ans. it is used for creating a class containing data and methods
